# Skeletal muscles - functions

- Produce skeletal movement
- Maintain postures and positions
- Stabilize joints
- Other functions not related to movement

- Muscle properties
  - Excitability
  - Contractability
  - Extensibility
  - Elasticity

Major muscles of the body. Right side: superficial; left side: deep (anterior view)

By OpenStax - https://cnx.org/contents/FPtK1zmh@8.25:fEI3C8Ot@10/Preface, CC BY 4.0, https://commons.wikimedia.org/w/index.php?curid=30015057

Excitability – Ability to respond to stimulation

Contractability – ability of a muscle to generate tension and shorten when it receives sufficient stimulation

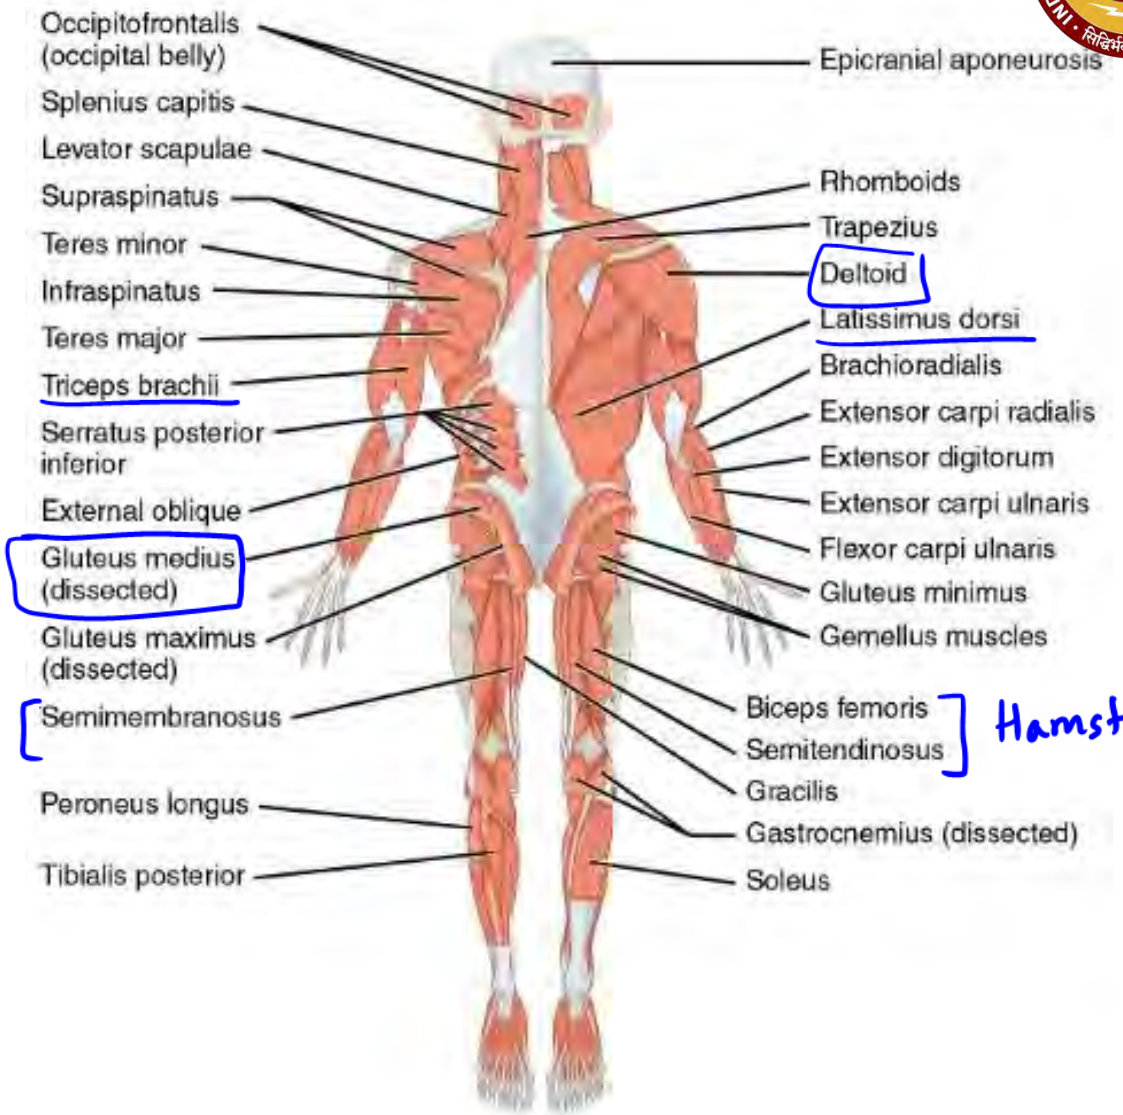

Extensibility – ability to lengthen beyond the resting length

Another muscle or ext. force is required

Elasticity – Ability to return to normal length after a stretch

# Skeletal muscles - structure

- Groups contained in compartments defined by fibrous tissue called fascia
- Fiber arrangements
  - Parallel
  - Pennate

Common for muscles in one compartment to be innervated by the same nerve

# Skeletal muscles - structure

Striated — Skeletal — voluntary control of the human
Cardiac
Smooth — not under voluntary control

- Groups contained in compartments defined by fibrous tissue called fascia
- Fiber arrangements
  - Parallel
  - Pennate

Parallel fibres are || to the long axis of the muscle

Greater range of shortening
⇒ higher movement velocity
|| muscles longer than other types & muscle fibre is longer than the tendon
